

NORTH STAR METRIC: THE WEEKLY CONSISTENCY SCORE (WCS)

The North Star Metric (NSM) for **fit.ai** is the **Weekly Consistency Score (WCS)**, defined as the **percentage of users who complete at least 5 minutes of movement on 5 or more days in a rolling 7-day period**.

Unlike traditional fitness apps that track total calories burned or duration, WCS prioritizes the frequency of "showing up" over the intensity of the effort. This metric directly aligns with your core thesis that micro-workouts (5–10 minutes) create the behavioral infrastructure necessary for long-term adherence.

1. Why This Metric Matters

- **Neutralizes the "All-or-Nothing" Mindset:** The primary psychological barrier in fitness is the **Abstinence Violation Effect**, where a single missed session leads to a total relapse. By measuring 5-minute "Consistency Wins," the WCS validates micro-efforts, preventing the shame-driven spiral that causes users to quit.
- **Survives the "Ramp-Period Crisis":** Research shows that **67% of all dropouts** occur during the initial ramp-up period (weeks 0–8) when intensity is often too high. The WCS focuses on habit stabilization during this critical window, ensuring users stay "in the game" long enough to survive the peak dropout phase.
- **Bridges the Intention–Behavior Gap:** There is an **82% variance** between a user's intention to exercise and their actual behavior. The WCS serves as the ultimate proof of an **Action Planning Wizard's** effectiveness—it measures the actual execution of daily "habit anchors" rather than just the initial goal setting.

2. How It Connects to User Value

- **Facilitates Identity Shift:** Habit strength has a **large correlation ($r=0.55$)** with exercise identity. A high WCS signals that a user is successfully transitioning from "trying to lose weight" (extrinsic) to "being a person who moves daily" (intrinsic identity).
- **Solves "Time Poverty":** The #1 reason for dropout is a **perceived lack of time (40%)**. The WCS provides immediate user value by legitimising 5-minute sessions as "successful," directly accommodating the chaotic lives of **Busy Professionals** and **Working Mothers**.
- **Visualizes Compounding ROI:** High consistency directly feeds the product's "**Time Math**" dashboard. When a user maintains a high WCS, they can see how their 5-minute daily "wins" compound into **30+ hours of annual fitness**, providing a sense of progress that scale weight alone cannot offer.

3. How It Connects to Business Value

- **Drives Long-Term Retention:** While the industry average for annual premium retention is **33%**, consistency is the strongest predictor of renewal. A user with a high WCS is significantly less likely to experience "**False Plateau Despair**" and churn during the month 2–6 window.
- **Optimizes LTV/CAC Ratio:** High-priced premium apps (\$79.99–\$99.99/year) earn **3x the lifetime value (LTV)** of low-priced competitors. By proving the micro-workout thesis through high WCS, fit.ai justifies a premium price point and achieves the target **3:1 LTV/CAC ratio** through organic word-of-mouth in professional networks.

- **Market Differentiation:** Most incumbents (Peloton, Nike, Apple Fitness+) focus on intensity and high-production content. Using WCS as your North Star creates a **moat of behavioral reliability**, positioning fit.ai as the only "lapse-friendly" design in a \$6.1 billion market obsessed with "heroic effort".
- **Targeting Profitability:** Reaching a **25% 30-day retention rate** on the premium tier is the primary hurdle for Year 1. WCS is the leading indicator that your primary segments—**Busy Professionals and Working Mothers**—are finding the product indispensable to their daily routines.

SUPPORTING KPIS FOR FIT.AI BEHAVIORAL INFRASTRUCTURE

As an AI product strategist, I have defined these six supporting Key Performance Indicators (KPIs) to complement your North Star Metric (Weekly Consistency Score). These metrics are specifically engineered to track how effectively the product bridges the **82% Intention–Behavior Gap** and navigates the **67% Ramp-Period Crisis** identified in the behavioral research.

Metric	What it Measures	Why it Matters
Action Planning Completion Rate	The percentage of users who complete the onboarding "Action Planning Wizard" to establish implementation intentions (anchoring workouts to daily routines).	This is the primary lead indicator for bridging the 82% variance between a user's intention and their actual exercise behavior.
Ramp-Period Survival	The percentage of new users who remain active at the end of the critical 8-week Phase 2 (Initiation) window.	It directly measures the product's success in preventing the 67% of dropouts that occur during the initial ramp-up phase before
Placeholder Activation	The frequency with which users opt for a 2-minute "placeholder" workout when the AI detects a life disruption or missed	This metric tracks the neutralization of the Abstinence Violation Effect (the "all-or-nothing" mindset), preventing a single
Multi-Metric Tracking	The average number of Non-Scale Victories (NSVs) —such as energy, sleep, and mood—logged per user per week.	High engagement here prevents " False Plateau Despair ," which typically causes users to quit between months 2 and 6 when
Micro-Workout	The ratio of 5–10 minute sessions to total workouts completed across the user base.	This validates the core product thesis for the 40% of users who cite "lack of time" as
Identity-Shift Mileston	The percentage of users who maintain a consistency streak of 12+ weeks , regardless of workout duration.	A 12-week streak is a proxy for the shift from extrinsic goals to an intrinsic exercise identity , which has a large

STRATEGIC CONTEXT OF THESE KPIS

- **B2C Unit Economics:** These behavioral KPIs are the drivers for your financial targets. For example, maintaining a high **Ramp-Period Survival Rate** is the only way to achieve the **3:1 LTV/CAC ratio** and the **25% 30-day premium retention rate** required for Year 2 profitability.
- **Segment Performance:** You should track these KPIs separately for **Busy Professionals** and **Working Mothers**. Research shows that **Working Mothers** often exhibit superior retention on premium tiers when they feel the app reduces "self-discipline friction" through micro-workouts.
- **AI Engine Optimization:** The **Placeholder Activation Rate** and **Action Planning Completion Rate** will serve as the primary feedback loops for your AI, allowing it to refine how it suggests "Coping Plans" to neutralize the shame-driven spirals that lead to relapse.

FIT.AI AARRR FUNNEL STRATEGY

The AARRR (Pirate Metrics) framework for **fit.ai** is specifically designed to address the **82% Intention–Behavior Gap** and the **67% Ramp-Period Crisis** identified in behavioral research. By shifting the focus from high-intensity output to **compounding consistency**, the funnel prioritizes habit stabilization as the primary driver for long-term business value.

Product-Market Funnel Mapping

Funnel	User Action	Key Metric
Acquisition	Target segments (Busy Professionals and Working Mothers) discover the app via	Cost Per Acquisition (CAC): Target of \$30 per user to achieve a sustainable 3:1
Activation	User completes the Action Planning Wizard during onboarding, setting "implementation intentions" (anchoring workouts to daily	Activation Rate: % of users who establish a "habit anchor" and log their first "win" within 24 hours of download.
Retention	User survives the critical 8-week Ramp-Period by maintaining a consistency streak, utilizing "Coping Plans" during life disruptions, and	Weekly Consistency Score (WCS): % of users completing 5+ days of movement per week; Day-60 Retention Rate (to
Revenue	User converts to the \$79.99/year premium subscription , primarily driven by high-intent iOS and wearable owners who see the value in	ARPU & LTV: Average Revenue Per User; Target Annual LTV of \$90+ based on a 33% industry-average renewal rate.
Referral	User shares their " Time Math " compounding milestones (e.g., "I've logged 10 hours of fitness in 5-minute chunks") or invites a peer to	Viral Coefficient (K-factor): Number of new users generated per active subscriber through professional and social network

STRATEGIC ANALYSIS BY STAGE

1. Acquisition: Quality Over Quantity

Acquisition focus is heavily weighted toward **iOS users** (who represent 60% of the market) and **wearable owners**, as they are **3.2x more likely to subscribe**. Marketing emphasizes "consistency over perfection" to attract the **40% of dropouts** who cite "lack of time" as their primary barrier.

2. Activation: Bridging the Gap

Activation is not just about account creation; it is about bridging the **82% variance** between intention and behavior. The product is "activated" when the user performs the cognitive task of **Action Planning**, which research identifies as a primary predictor of initiation.

3. Retention: The Core Engine

Retention is the most critical stage for fit.ai. The AI engine focuses on keeping users through **Phase 2 (Initiation)** and **Phase 4 (Plateau)**. By reframing progress through **multi-metric dashboards** (energy, sleep, strength), the app prevents the "False Plateau Despair" that leads to the industry-standard **50% dropout rate by month 6**.

4. Revenue: Premium Identity

Revenue is driven by **annual subscriptions** rather than monthly, as annual users show higher commitment and better LTV. The goal is to reach **250,000 premium subscribers** to achieve profitability, leveraging the fact that high-priced fitness apps (top 25%) earn **3x the LTV** of low-priced competitors.

5. Referral: Social Proof of Compounding

Referral logic leverages **exercise-specific social support**, which is a stronger predictor of adherence than general support. By allowing users to share the **compounding ROI** of their micro-efforts (e.g., total annual hours logged), the app builds organic growth within high-value professional and parenting networks.

STRATEGIC A/B TEST DESIGN: NEUTRALISING THE "ALL-OR-NOTHING" MINDSET

As an AI product strategist, the most critical friction point to test for **fit.ai** is the **Abstinence Violation Effect (AVE)**—the cognitive trap where a single missed session leads to a total habit collapse. By testing "Coping Plans" against standard notifications, we can validate the core thesis that micro-workouts preserve long-term consistency through compounding.

1. Hypothesis

If we offer a **2-minute "Placeholder" micro-workout (Coping Plan)** when a user reports a scheduling conflict, then they will maintain a higher **Weekly Consistency Score (WCS)** and lower Day-30 churn compared to users who receive standard "missed session" notifications. This is because the micro-session legitimises "showing up" during "Time Poverty" windows, neutralises the **Abstinence Violation Effect**, and reinforces the **"Daily Mover" identity** ($r=0.55$ correlation with habit strength).

2. Control Version: The "Standard Accountability" Model

- **User Experience:** When a scheduled workout window is missed, the user receives a standard push notification: *"You missed your workout today. Don't worry, get back to it tomorrow!"*
- **Streak Logic:** The user's consistency streak is marked as **broken** unless the full-duration workout is completed before the day ends.
- **Dashboard:** No progress is added to the "Time Math" or compounding dashboard for that day.

3. Target Version: The "Lapse-Resilient" Model

- **User Experience:** When a user is detected as "at-risk" (via a missed window or manual "Busy" toggle), the AI prompts: *"Busy day? Don't break the chain. Just give us 2 minutes to keep your streak alive."*
- **The Intervention:** The user is offered a **2-minute "Baseline" routine** (e.g., mobility or breathing).
- **Streak Logic:** Completing the 2-minute session **preserves the consistency streak**.
- **Dashboard:** The "Time Math" dashboard updates to show even these 2 minutes are compounding toward their annual goal (e.g., *"Those 2 minutes just added another win to your 30-hour annual goal"*).

4. Target Users

- **Primary Segments:** **Busy Professionals** (aged 18–45) and **Working Mothers** (aged 25–45).
- **Behavioral Profile:** Users in **Phase 2 (Initiation)** or **Phase 3 (Early Adherence)** who cite "lack of time" as their #1 barrier (40% of dropouts) and are susceptible to the 82% variance gap between intention and behavior.

5. Primary Success Metric

- **Weekly Consistency Score (WCS):** The percentage of users who complete at least 5 minutes of movement (including placeholders) on 5 or more days in a rolling 7-day window.

6. Secondary Metrics

- **Day-30 Retention Rate:** To measure if placeholder sessions successfully navigate the **67% Ramp-Period Crisis**.
- **Lapse Recovery Velocity:** The average number of days it takes a user to return to a standard-duration session (10+ mins) after using a placeholder.
- **PA (Physical Activity) Self-Efficacy:** Subjective user feedback on their confidence to maintain the habit despite lifestyle disruptions.

7. Success Criteria

The experiment will be considered a success if the **Target Version** demonstrates:

- A statistically significant ($p < 0.05$) increase of at least **15% in the Weekly Consistency Score**.
- A **20% reduction in Day-30 churn** compared to the Control.
- Qualitative data indicating a shift in user sentiment from "guilt" to "competence" (Satisfaction of Competence Needs), which is a central driver for long-term adherence.

FIT.AI STRATEGIC DASHBOARD PLAN

To bridge the **82% Intention–Behavior Gap** and navigate the **67% Ramp-Period Crisis**, the **fit.ai** dashboard must shift focus from "effort" to "infrastructure." This plan outlines the core dashboards required to maintain the user's consistency and demonstrate the power of compounding progress.

Core Behavioral & Strategic Dashboards

Dashboard Action	Metrics Shown	User of Dashboard	Frequency of Review
Progress Tracking & Identity Reinforcement	Weekly Consistency Score (WCS) ; "Time Math" (Cumulative annual hours logged); Non-Scale Victories (NSVs) (Energy, mood, sleep quality).	End User (Busy Professionals, Working Mothers)	Daily (To reinforce the "Daily Mover" identity)
Contextual Scheduling & Load Management	Daily Time Window (5-10 min suggested based on calendar gaps); Placeholder Activation Rate (Use of 2-min coping templates); Stress/Self-Efficacy Scores .	End User & AI Coaching Engine	Daily (Triggered by calendar sync or high-stress logs)
Program Scaling & Risk Detection	Shallow Progression Stage (Week X of 8); Early Burnout Indicators (Sudden RPE spikes); Ramp-Period Survival Trend .	End User (Visibility) & Product Team (Monitoring)	Weekly (At the end of each habit-forming micro-cycle)
Internal Growth & North Star Monitoring	Weekly Consistency Score (WCS) ; Activation Rate (Planning Wizard completion); LTV/CAC Ratio ; Retention by Segment .	fit.ai Strategic Team (Product/Growth)	Weekly / Monthly
Corporate Wellness ROI Visualization	Aggregate Active Minutes ; Engagement Continuity Rate ; Population Mental Health/Energy Shift (Anonymised).	Enterprise Partners (HR/Benefits Directors)	Monthly / Quarterly

STRATEGIC DASHBOARD COMPONENTS & RATIONALE

1. The "Identity Engine" (User-Facing)

The primary goal of the user dashboard is to facilitate a shift from extrinsic goals to an **intrinsic exercise identity**, which has a large effect size (**$r=0.55$**) on habit strength.

- **Time Math Visualization:** Instead of showing "calories burned," the dashboard must show the **cumulative ROI** of micro-efforts (e.g., "Your 5 minutes today brings you to 12 hours of annual fitness").
- **Neutralizing AVE:** By highlighting "Consistency Wins" regardless of duration, the dashboard neutralizes the **Abstinence Violation Effect** (all-or-nothing mindset).

2. The "Ramp-Period Shield" (AI Management)

Since **67% of dropouts** occur during the initial ramp-up, the dashboard acts as a governor.

- **Shallow Progression Status:** For the first 8 weeks, the dashboard prioritizes "Days Active" over "Intensity".
- **Lapse Resilience:** It prominently displays "Coping Templates" for high-conflict days (work crises or family obligations) to keep the streak alive with a 2-minute baseline workout.

3. Multi-Metric Feedback (Anti-Plateau Logic)

To prevent "**False Plateau Despair**" that causes dropout between months 2 and 6, the dashboard avoids single-metric (scale weight) fixation.

- **Non-Scale Victories (NSVs):** The user sees progress in energy levels and strength, which are more immediate and motivating than physiological weight changes.
- **Realistic Timeline Education:** The dashboard provides context on healthy weight loss (0.5–1 kg/week) to align expectations with reality.

4. Team-Level Strategic Insights

For the product team, the dashboard monitors the **AARRR funnel** to ensure a sustainable business model.

- **Activation Rate:** Measuring how many users complete the **Action Planning Wizard**, as planning is the primary bridge for the **82% Intention–Behavior Gap**.
- **High-Value Segment Tracking:** Monitoring performance for **Working Mothers** and **Busy Professionals**, as they exhibit superior premium conversion and retention.

GO-TO-MARKET STRATEGY: FIT.AI

This Go-to-Market (GTM) plan is engineered to address the **82% Intention-Behavior Gap** and the **67% Ramp-Period Crisis** identified in our behavioral research. By focusing on "behavioral infrastructure" over mere content delivery, **fit.ai** will position itself as the essential tool for long-term fitness adherence through the power of compounding.

1. Target Audience

The launch will focus on two primary segments that represent approximately **40% of the fitness app addressable market** and exhibit the highest willingness to pay.

- **Busy Professionals (18–45 years):**
 - **Profile:** Urban, high-income (\$75,000+), college-educated, and tech-native.
 - **Pain Point:** They cite "lack of time" as their #1 dropout reason (40%) and struggle with work and lifestyle conflicts.
 - **Strategic Fit:** They respond to the "compounding narrative" and "time math" (e.g., 5 min daily = 30 hours/year) that aligns with a professional ROI mindset.
- **Working Mothers (25–45 years):**
 - **Profile:** 60% of the current fitness app user base; frequently juggling childcare and work.
 - **Pain Point:** High susceptibility to "guilt and shame" after missed sessions and unrealistic transformation expectations.
 - **Strategic Fit:** They prioritize **convenience and privacy**; **fit.ai** offers a non-judgmental path that validates 5-minute home sessions as successful "wins".

2. Positioning Statement

For time-constrained professionals and mothers who struggle to maintain a consistent workout routine, **fit.ai** is the AI-driven behavioral infrastructure **that** stabilizes exercise habits through 5-minute micro-workouts and compounding logic. **Unlike** incumbents like Peloton or Apple Fitness+ that demand "heroic efforts" and contribute to early burnout, **fit.ai** bridges the 82% intention-behavior gap by legitimising small, daily efforts as the foundation of a long-term identity shift.

3. Launch Channels

The launch strategy leverages platforms with high-intent users who match our primary segments' demographics.

- **iOS App Store (ASO):** This is the prioritized platform because iOS users represent **60% of the market** and are **3.2x more likely to subscribe** than non-wearable users.
- **LinkedIn & Professional Networks:** Targeting **Busy Professionals** with content focusing on "Fitness ROI" and how micro-movement enhances professional performance.
- **Parenting & Wellness Influencers:** Partnering with micro-influencers to reach **Working Mothers**, emphasizing non-judgmental progress and the convenience of 5-minute "baby nap" routines.
- **Productivity Tool Affiliates:** Collaborating with calendar and task management apps to suggest low-friction 5-minute "stolen time" slots.

4. Key Messaging

Our messaging counteracts the "all-or-nothing" mindset that leads to a **~50% dropout rate by month six**.

- **The Consistency Hook:** "5 minutes of consistency beats 60 minutes of heroic effort".
- **The Compounding Promise:** "Turn 5 minutes a day into 30+ hours of fitness per year".
- **The Identity Reframe:** "Stop trying to lose weight; start being a person who moves every day" (Identity shift has an $r=0.55$ correlation with habit strength).
- **The Resilience Message:** "Lapses are normal. Our 2-minute coping plans keep your habit alive even on your busiest days".

5. Launch Checklist

To navigate the **67% Ramp-Period Crisis**, these items must be verified prior to the MVP launch.

- **[] Action Planning Wizard:** Onboarding must include "implementation intentions" to bridge the 82% intention-behavior gap.
- **[] Shallow Progression Logic:** Ensure the AI strictly limits intensity for the first 8 weeks to prevent early burnout or injury.
- **[] Coping Plan Templates:** Finalize "one-tap" 2-minute placeholder routines to neutralize the **Abstinence Violation Effect** after a lapse.
- **[] Multi-Metric Dashboard:** Confirm tracking for **Non-Scale Victories (NSVs)**—energy, mood, and strength—to prevent "False Plateau Despair".
- **[] Premium Pricing Integration:** Set an annual subscription tier (target: \$79.99/year) to achieve a sustainable 3:1 LTV/CAC ratio.
- **[] Privacy-First Home Workout UI:** Verify that the app prioritizes a private, home-based experience to satisfy the core motivation of female users.

STRATEGIC MONETIZATION MODEL: FIT.AI

To align with the core product thesis of **consistency** and **compounding**, the monetization strategy for **fit.ai** is designed to incentivize long-term commitment while lowering the barrier to entry. This model is engineered to capture high-value segments—**Busy Professionals** and **Working Mothers**—who represent the highest willingness to pay and superior retention profiles.

1. The Core Monetization Structure

Primary Model: The "Compounding Commitment" (Freemium to Annual Subscription) The primary revenue driver is a **Premium Annual Subscription** priced at **\$79.99–\$99.99/year**. This aligns with industry benchmarks where high-priced apps in the top 25% earn **3× the lifetime value (LTV)** of low-priced competitors.

- **Free Tier (The Behavioral Gateway):**
 - **Access:** Limited micro-workout library (5-minute sessions), basic streak tracking, and the "Action Planning Wizard" to bridge the **82% Intention–Behavior Gap**.
 - **Purpose:** To build the initial habit loop and "Daily Mover" identity without financial friction, especially during the critical **Phase 2 (Initiation)** where 67% of dropouts occur.
- **Premium Tier (The Compounding Engine):**
 - **Price:** \$79.99/year (proven price point for iOS-heavy, high-intent segments).
 - **Features:** Full micro-workout library, **AI Adaptive Adherence Engine**, "Coping Plan" templates, wearable integration (Apple Watch), and the **Multi-Metric "Time Math" Dashboard** to visualize compounding ROI.
 - **Strategy:** Prioritizing annual over monthly subscriptions. Research shows that annual subscribers are less likely to churn at monthly renewal points, and a premium purchase in the first 30 days is linked to a **72% annual retention rate**.

2. Secondary and Future Monetization Streams

- **Enterprise / B2B Licensing (Year 2 Strategy):**
 - **Model:** Bulk licensing for corporate wellness programs at **\$2–\$5 per employee** per month.
 - **Rationale:** The B2B wellness market is a **\$67+ billion opportunity**. By proving ROI (like the Cigna-Headspace model which saw an 8% reduction in mental health claims), fit.ai can secure predictable, contractual revenue with significantly lower CAC than B2C.
- **Consumable Unlocks (Gen Z Engagement):**
 - **Model:** One-time purchases for specific "Premium Content Packs" or "Specialized Recovery Analytics".
 - **Rationale:** Gen Z and Millennials (who drive 60% of gym growth) respond well to a mix of subscriptions and consumables, allowing for monetization of the "shiny object" syndrome.

3. Strategic Rationale: Why This Model Fits the Product

A. Psychology of Commitment vs. Churn The annual subscription model is a psychological "lock-in" that supports the **Identity Shift (r=0.55 correlation)** needed for Phase 6 (Maintenance). Monthly pricing often triggers a "re-evaluation" of the habit every 30 days; by contrast, an annual

commitment removes this friction, allowing the user to focus on the long-term effect of compounding.

B. Alignment with High-Value Segments

- **Working Mothers:** This segment has a **2–3× higher premium conversion rate** than men. They view fitness as an essential investment in their energy and privacy, making them highly receptive to a \$79.99+ annual price point that saves them time.
- **Busy Professionals:** They respond to the "Time Math" ROI narrative. A premium price point signals quality and legitimacy to this analytical, high-income (\$75k+) cohort.

C. Unit Economics and Profitability To achieve Year 2 profitability, fit.ai must reach **250,000 premium subscribers**. The \$79.99/year model provides the necessary margins to maintain a **3:1 LTV/CAC ratio**, assuming a \$30 acquisition cost and a 33% industry-average renewal rate.

D. Neutralizing "False Plateau Despair" By charging upfront for the year, the business is protected during **Phase 4 (Plateau)**—the window between months 2 and 6 where users often quit if they don't see immediate weight loss. The subscription ensures the AI has the time to shift user focus to **Non-Scale Victories (NSVs)** and prove the compounding thesis over a full 12-month cycle.

POST-LAUNCH FEEDBACK & STRATEGIC ITERATION PLAN

To ensure **fit.ai** successfully bridges the **82% Intention–Behavior Gap** and survives the **67% Ramp-Period Crisis**, a robust feedback loop is essential. This plan focuses on gathering data that validates our core thesis: that **consistency through micro-workouts** leads to long-term identity shifts and compounding physical gains.

1. Feedback Channels

We will utilize multi-layered channels to capture both quantitative behavioral data and qualitative user sentiment, specifically tailored to our primary segments: **Busy Professionals** and **Working Mothers**.

- **In-App Micro-Surveys:** Immediate prompts following a micro-workout to capture "Affective Experience" (how the user felt) and **Perceived Exertion (RPE)**.
- **Segment-Specific Community Forums:** Non-judgmental peer support spaces for **Working Mothers** to discuss barriers like childcare and guilt.
- **Predictive Churn Interviews:** Automated outreach to users whose **Weekly Consistency Score (WCS)** drops, specifically targeting those entering the high-risk **Month 2–6 plateau phase**.
- **Wearable Sync Analytics:** Deep-dive analysis into heart rate and activity ring data for **Apple Watch users** (who are **3.2x more likely to subscribe**) to verify if micro-workouts are providing the intended physiological baseline.
- **"Coping Plan" Effectiveness Logs:** A specific feedback channel triggered whenever a user activates a **2-minute placeholder session** to see if it successfully neutralized the **Abstinence Violation Effect**.

2. What Feedback Will Be Collected

The feedback collection strategy is designed to monitor the most critical behavioral triggers identified in our research.

- **Affective Experience:** Measuring enjoyment during exercise, which is a **strong predictor of future participation**.
- **PA (Physical Activity) Self-Efficacy:** Tracking user confidence in maintaining their habit despite life disruptions like travel or work crises.
- **Action Planning Friction:** Identifying where users struggle within the **Action Planning Wizard** to link workouts to their existing daily "habit anchors".
- **Non-Scale Victory (NSV) Resonance:** Determining which metrics (energy, sleep quality, strength gains) most effectively counteract **"False Plateau Despair"** when scale weight stagnates.
- **Identity Shift Markers:** Qualitative evidence of users moving from extrinsic "outcome-only" goals (e.g., losing 10lbs) to an **intrinsic identity** ("I am someone who moves every day").

3. How Feedback Will Influence Future Iterations

Feedback is not just for observation; it is the primary driver for our **Adaptive Adherence Engine**.

- **Refining Shallow Progression:** If RPE data shows users are finding the early weeks too difficult, the AI will **force a shallower intensity curve** to prevent the 67% ramp-period dropout.
- **Optimizing Coping Templates:** If "Coping Plans" aren't being activated during work crises, we will iterate on the **scheduling logic** to suggest even lower-friction "stolen minute" windows.
- **Dashboard Personalization:** Feedback on NSVs will allow us to **customise the "Time Math" dashboard**, showing the specific compounding ROI (e.g., "Your 5-minute sessions added 2 hours of deep sleep this month") that most motivates each user.
- **Bridging the Intent-Behavior Gap:** Data on failed "habit anchors" will influence the **onboarding wizard**, providing better "if-then" suggestions for busy users.

4. Rationale: Why the Pricing Model Fits the Product

The chosen **Premium Annual Subscription (\$79.99–\$99.99/year)** is strategically aligned with the **fit.ai compounding thesis** and the economic realities of the fitness market.

- **Neutralizes the Month 6 Churn Window:** Approximately **50% of exercisers quit within 6 months**. An annual commitment ensures users stay in the program long enough for the **habit–identity shift ($r=0.55$)** to take root, moving them past the physiological plateau.
- **Matches High-LTV Segment Behavior:** **Working Mothers** and **iOS users** exhibit a high willingness to pay for solutions that provide convenience and privacy. Annual subscribers in this cohort show a **72% retention rate** compared to monthly users.
- **Supports "Time Math" Legitimacy:** A premium price point signals that **5-minute sessions are "viable and valuable"** professional-grade interventions, not just a gimmick, appealing to the analytical mindset of **Busy Professionals**.
- **Achieves Sustainable Unit Economics:** This model supports the **3:1 LTV/CAC ratio** required for Year 2 profitability, leveraging the **3x LTV multiplier** seen in high-priced fitness apps compared to low-priced competitors.
